Tsiang&Havas. **COVID-19 Attributed Cases and Deaths are Statistically Higher in States and Counties with 5th Generation Millimeter Wave Wireless Telecommunications in the United States**. European Society of Medicine. April 2021 <https://esmed.org/MRA/mra/article/view/2371/193545802>

-COVID-19-attributed case and death rates for the U.S.A. were analyzed through May 2020 in three ways –for all 50 states, the country’s largest counties, and the largest counties in California –and found to be statistically significantly higher for states and counties with compared to those without 5G millimeter wave (mmW) technology.

Abstract. The paper considers a hypothesis concerned the possible influence of electromagnetic pollution of the environment on the lethality rate of the population from coronavirus infection, along with other factors. The hypothesis is indirectly confirmed by the correlation between the degree of rigidity of hygienic regulations of radio frequency electromagnetic background levels for the population, which are mainly created by mobile (cellular) communication systems, and the lethality rate from COVID-19 in various countries. A special measures to ensure the safety of rapid development of technologies, systems and services for mobile communications of the fourth (4G), fifth (5G), and, by 2030, the sixth (6G) generation, associated with an increase by several orders of magnitude in the number of radiating devices, the data transmission rates over

**Lethality of COVID-19 is higher
in countries that have a
higher Maximum Permissible Limit RFR**
